

ABSTRACT

A suspender clip having a downwardly extending slant-faced face plate in order to exert a greater pressure onto the cloth of the pants to which the suspender is attached. The slant of the face plate is at a downwardly extending angle with relation to the back plate of the suspender clip, and this angle is created by a raised face plate hip which stands taller than a normal hip and thereby applies a greater pressure to the top of the suspender clip. Suspender clip preferably includes a cloth piercing needle and has a needle receiving orifice on the back plate for receiving and securing cloth therein.
